Symbols and specifications

- Q = Air volume in m³/h
 - Ak = Effective surface (free area) in m²
 - B = Distance between the diffusers in m
 - H = Installation height of the diffusers in m
 - Vz = Maximum velocity at the occupied zone according to distance between the diffusers and installation height in m/s
 - Vk = Average effective velocity through the diffuser in m/s
 - X0.25 = Throw length in m at an end velocity Vt of 0,25m/s
 - Ps = Static pressure loss given in Pa
 - Lw(A) = Acoustic power in dB(A)
- The throw X0.25 is given at an end velocity of 0.25m/s for a smooth ceiling without any obstacles.
 - The values are given for isothermal supply air. Throw distances for cooling conditions at -11K can be calculated by dividing the X0.25 values with factor 1.1. For heating purposes at Dt of +11K a multiplier of 1.1 should be applied to the given X0.25 value.
 - In order to achieve a high comfort level, selections can be made according to the maximal velocity at the occupied zone Vz. These values are given at distances between diffusers B and installation heights H. Velocities Vz lower than, or equal to 0,25m/s at the occupied zone are advised.
 - The pressure losses Ps are given for diffusers without damper or with fully opened damper.
 - The acoustic power values Lw(A) are given for diffusers without damper or with fully opened damper without room attenuation. Acoustic powers below 20dB(A) are mentioned as "<20" in the tables.
