

Communication module for DX air curtains type ACA-DX-BOX

This box provides the communication between the Fujitsu outdoor unit (inverter) and the DX air curtain. The box is equipped with two temperature sensors: a surface sensor and a room sensor. The surface sensor is to be mounted on the battery outlet (thinnest line) in order to be able to measure a correct temperature value. This sensor should be given all the attention by the installer as a proper regulation of this is largely dependent. The room sensor is placed in the suction of the DX air curtain.

Application

This box allows you to control a DX air curtain with an Fujitsu outdoor unit (inverter). The plug and play box is equipped with a programmed ATW module (communication module) mounted on a DIN-rail and equipped with all necessary cables and sensors.
